Brand New Book ***** Print on Demand *****.Excerpt from The Astrophysical Journal, Vol. 19: An International Review of Spectroscopy and Astronomical Physics You are all aware, of course, that the Carnot-Clausius principle, that is to say, the so-called second law of thermodynamics, is one of the most general and most fruitful laws of contemporary physics. But it is also one of the most difficult to understand and to master in the concrete. Every series of arguments connecting this law either with experimental data or with equations of analytical mechanics, or, finally, with the principles of the theory of probabilities - in every case the light falls only on one side of the law, and no formula has yet been found to express completely its full scope. Read before the Philosophical Society of Washington, November 7, 1903, by the authors. Vol. XXXIV, No. 5, pp. 155 201, 1902 (Russian). It is very unfortunate that this paper has not been translated into some one of the more familiar languages of scientific literature. W. Michelson was the first to attempt to formulate a general equation for the distribution of energy in the continuous spectrum, and his critical examination of the steps by which the study of ether thermodynamics has advanced in the fifteen years since that time is itself a splendid contribution to the progress of the science. The authors are indebted to this paper all through the present discussion, and only regret that limits of space and title prevent the reproduction of considerable portions of it in extenso. The extracts here reproduced were translated by Mr. Robert Stein, of the U. S. Geological Survey. About the Publisher Forgotten Books publishes hundreds of thousands of rare and...
