These include homeostasis; immunity; hematopoiesis; fertility and embryogenesis; cell proliferation, differentiation, cell cycle division and apoptosis; and gene expression. Impairment of integrins functions causes the dramatic remodeling of these processes. Prolonged therapy with anti- α 4 antibodies may result in severe pathological consequences, including generalized immunosuppression leading to an extreme risk of very serious infections; uncontrolled proliferation and altered differentiation of hematopoietic cells possibly leading to hematological abnormalities and increased risk of malignancies; and alterations in spermatogenesis, fertility, and embryonic development. Natalizumab (Tysabri) is an impressively effective drug. In the professional opinion of well-known neurologists it is considered to be a promising agent for the treatment of multiple sclerosis. However, whereas the evaluation of the drug s benefits can be done by neurologists alone, it is mandatory that the risk in using this agent should be assessed by a team of experts in a number of fields: immunology, infectious diseases, hematology, oncology, and embryology. It is essential to recognize that innovative integrin-antagonist therapy, e.g. therapy with anti- α 4 integrin monoclonal antibodies, must be handled with extreme caution.
